

Lecture 11

November 19, 2025

Course Project Presentations

Team	Time Slot	Team Members	Introduction
1	13:10 - 13:15	Jia Shu Zhang, Ray Jiarui Dai, Kimberly Hau, Ahmed AboElhiba	FIDO
2	13:16 - 13:21	Yuhao Cao, Qiwen Lin, Liz Zhu	DropMate
3	13:22 - 13:27	Patrick Chamaa, Jiale Shang, Gaurav Kashyap, Jingxian Hou	Therapy Companion
4	13:28 - 13:33	Ziyan Liu, Spiro Li, Jerry Chen, Muchen Liu	UConnect
5	13:34 - 13:39	Yijun Chen, Bart Cui	Travel Companion
6	13:40 - 13:45	Devanshu Singhvi, Eric Huang, Kinkini Monaragala, Hamza Choudhary	Habitly
7	13:46 - 13:51	Guanqun Dong, Zijin Liao, Tianqi Ju, Xingda Jiang	Campus Marketplace
8	13:52 - 13:57	Jinyan Yi, Zixi Qu, Kangzhi Gao	Bill Splitter
9	14:05 - 14:10	Hao-Chih Huang, Linfeng Gao, Zifeng Liang, Jinghan Song	StudyBlocks
10	14:11 - 14:16	Xiangyu Liu, Zihao Gong, Zixuan Huang	MiniTune
11	14:17 - 14:22	Dechen Han, Ginny Ji, Kexin Sha	SnapSplit
12	14:23 - 14:28	Yuanrong Han, Chenxu Wang, Qinglang Yu	Taro
13	14:29 - 14:34	Kiirou Huang	Trilingo
14	14:35 - 14:40	Yuye Huang, Siyu Shao, Boyan Liang	Collaborative Task Manager

Team	Time Slot	Team Members	Introduction
15	14:45 - 14:50	Nilofer Hyder, Taniya Peterratnaraj, Jesse Na, Nagham Sabbour	Bespoke
16	14:51 - 14:56	Yiduo Jing, Sitao Wang	LocalGuide

Project Introduction

Team 1: FIDO

Team 1 built FIDO, a gamified nutrition app featuring Fido, your new digital pet who will help you meet your dietary goals in a playful, goal-oriented manner. Users can set their daily nutrition goals, and easily input meals to track their progress without the intensive data tracking that comes with conventional nutrition trackers. Fido will also encourage users with mood states reflecting progress, and meal recommendations. The app uses Expo Router for dynamic file-based navigation, Context API and Redux Toolkit for state management with AsyncStorage persistence, Expo Notifications for session alerts, and Supabase for user auth and leaderboards.

Team 2: DropMate

Team 2 built DropMate, which is a mobile app designed to help small business owners, delivery drivers, and customers manage and track deliveries with better transparency and control. It enables real-time package tracking and delivery status updates with push notifications to keep all parties informed during the delivery process. The app is built with React Native and TypeScript. It uses Redux Toolkit with AsyncStorage for state persistence, React Navigation for seamless screen flow, and Expo Notifications for timely customer alerts. DropMate brings affordable, cloud-based delivery management to small-scale logistics.

Team 3: Therapy Companion

Group 3 built a mobile therapy companion app designed to help users track their mood, write reflective journals, and chat with an AI support agent. The app is built with Expo and uses Expo Router for file-based navigation, Context API with AsyncStorage for persistent state, and Expo Notifications to deliver daily check-in reminders. Supabase powers our backend services and authentication. Our goal is to provide an accessible, calming space where users can monitor their emotional patterns and receive supportive, conversational guidance over time.

Team 4: UConnect

Team 4 built UConnect, a mobile event platform that simplifies activity management for university organizations and helps students easily discover and register for campus events. Organizers can create events, upload images, and update details in real time, while students can browse activities, register with one tap, and receive timely reminders. UConnect is built with Expo Router for structured navigation, Redux Toolkit for state management and

persistence, Supabase for authentication, activity storage, and backend logic, and Expo Notifications for schedule alerts and real-time updates to both organizers and participants.

Team 5: Travel Companion

Our goal is to build a travel companion app that helps users plan, track, and relive their trips by combining practical trip management with a personal journaling experience. TravelMate's design focuses on being lightweight and emotionally engaging. We built the app using Expo Router for multi-screen navigation, Context API and Async Storage for global state and persistence, Expo Notifications for scheduled trip reminders, and Firebase as our backend for authentication and cloud-synced trip data. Our objectives follow a logical flow from building the app foundation, to fulfilling core functionality, reliable data handling, adding smart travel utilities, and finally supporting personalization and deployment.

Team 6: Habitly

Team 6 built Habitly, a minimalist daily habit tracker designed to help students, young professionals, and wellness-minded users build consistent routines. Habitly allows users to create habits, track completions, view streaks and analytics, and receive personalized reminders. The app features smart insights on productivity patterns and motivational quotes to support long-term engagement. Built with React Native and Expo, it uses Expo Router for navigation, React Context with AsyncStorage for persistence, Supabase for authentication and syncing, and Expo Notifications for scheduled habit reminders.

Team 7: Campus Marketplace

Team 7 built Campus Marketplace, a mobile platform that helps university students buy and sell second-hand textbooks, electronics, and other essentials within campus. Users can browse listings, post items with photos, maintain a shopping cart, and chat with buyers or sellers in real time. The app uses Expo Router for typed navigation, React Context with AsyncStorage for session management, and device APIs such as the camera and location. Our backend is powered by Django REST, MySQL, Redis, and Elasticsearch for fast search and messaging. The goal is to provide a safe, campus-focused resale experience.

Team 8: Bill Splitter

Bill Splitter is a mobile app to simplify bill splitting and logging expenses among friends, targeting groups that need one centralized place to record shared expenses and the resulting balanced debt. Core features include dividing bills and providing a clear, real-time financial overview. The app uses React Native and TamaGUI, with Expo Router for navigation and Redux Toolkit combined with Async Storage for persistent state management. Supabase handles user authentication and push notifications for event updates.

Team 9: StudyBlocks

StudyBlocks is a mobile study planner that turns course deadlines into daily, manageable focus blocks. It is designed for university students juggling heavy course loads who want a realistic plan instead of last-minute

cramming.

The planner generates and updates study blocks from any task with a due date, then links them to an in-app focus timer with break prompts and simple progress dashboards.

It is built with Expo Router, React Context with AsyncStorage, Expo Notifications, and a mock REST API.

Team 10: MiniTune

Team 10 built MiniTune, a mobile music discovery and listening app for students and casual listeners who want a curated library that also works offline. Users can browse and search tracks, mark favourites, download songs for offline playback, and receive notification for music recommendations based on recent likes. The app uses Expo Router for multi-screen navigation, Redux Toolkit for state management, React Native Async Storage to persist downloaded tracks, Supabase for authentication and music metadata, and Expo Notifications for notification. The team goal is to make lightweight, personalized listening effortless on any device.

Team 11: SnapSplit

SnapSplit is a mobile app that helps groups quickly share and sort photos after trips or events. It is made for friends, families, classmates or any groups who take many pictures together and want an easy way to get their own photos after an event. The app lets users upload photos, place them into shared albums, and assign each photo to the right person. SnapSplit is built with React Native using Firebase, Expo Router and Expo Notifications, making the sharing experience simple and smooth.

Team 12: Taro

Team 12 built Taro, a mobile platform that streamlines professional networking through structured coffee chats. Users can create coffee chat invites, discover and show interest in coffee chat invites in one app. The app is built with React Native and Expo Router for seamless mobile navigation, Redux Toolkit with AsyncStorage for state persistence, while Firebase Cloud Messaging delivers real-time notifications and reminders for upcoming chats. On the backend, Taro employs an event-driven architecture powered by Redis Streams and a Golang-based Publisher–Broker–Subscriber model to handle requests. Our goal is to simplify professional networking for students and early-career professionals.

Team 13: Trilingo

Trilingo is designed for Multilingual learners fluent in English and French who wish to expand into Spanish (or vice versa). It lets users search and view aligned synonym sets with glosses and examples across English, French, and Spanish, and jump across related lemmas to explore vocabulary. Users can star words into an offline saved list and receive daily notifications to review them. The app uses Expo Router for tab and stack navigation, Redux Toolkit with AsyncStorage for shared states and persistence, Expo Notifications, and a containerized FastAPI backend deployed to the cloud and exposed via a dedicated custom domain.

Team 14: Collaborative Task Manager

Our team built Collaborative Task Manager, a mobile productivity app for individuals and small groups to organize tasks and coordinate work. Users can create, edit, and prioritize tasks, attach images using Expo ImagePicker, and receive deadline reminders through Expo Notifications. The app uses Expo Router for file-based navigation, Context/Redux Toolkit for global state with AsyncStorage persistence, and stores tasks securely in Firebase alongside Firebase Authentication for user login. Our goal is to enable lightweight team collaboration with intuitive interactions, dynamic API data, and seamless device integration.

Team 15: Bespoke

Team 15 built Bespoke, an app that lets you explore different types of media in one place. Currently, there are many sites for specific media, like Goodreads for books, Rotten Tomatoes for movies, etc., but there is no all-in-one review hub for multiple different media. This app targets users who enjoy many forms of media. It enables them to search, rate, review and organize the media into collections. It's built using React Native components, Expo Router for navigation, Redux Toolkit for Async Storage and Persistence, Supabase for the backend, and Expo Notifications for both regular and push notifications.

Team 16: LocalGuide

Team 16 developed LocalGuide, a lightweight mobile app designed for local adventurers to record, revisit, and organize their discoveries. Users can log in using Google OAuth to add and view points of interest, which include a name, category, location, and description. The app uses Expo Router for file-based navigation, Redux Toolkit for state management with AsyncStorage for data persistence, and Expo Notifications to remind users to log points of interest. Our goal is to provide local adventurers with a personalized experience for logging their explorations in a safe, simple, and intuitive manner.
