

Presentation Logistics

This page outlines how the in-class project presentations will be conducted. Please read carefully to ensure a smooth and fair experience for all teams.

Presentation schedules:

- [Lecture 11 Presentation Slots](#)
- [Lecture 12 Presentation Slots](#)

Arrival and Seating

- Class begins **promptly at 13:10**.
- All presenting teams should arrive by **13:05** to test display connections and get seated.
- At any time, the **next three teams** should be seated in the **front row**, ready to present.

Time Allocation (Strictly Enforced)

Each team has:

- **5 minutes** to present
- **1 minute** to transition to the next team

To ensure fairness to all teams and to respect classroom booking times, **the 5-minute limit will be strictly enforced**.

- At **1 minute remaining**, the instructor will give a hand signal.
- At **5 minutes**, the presentation **MUST stop immediately**, regardless of completion.

We strongly recommend practicing **timed rehearsals** in advance.

Required Written Introduction (Due November 17)

To allow each presentation to begin immediately with features and technical demonstration, each team must submit a short **written introduction (70–100 words)** to [Quercus](#) [↗] by **November 17, 2025, 11:59 PM EST**. The instructor will read this introduction while your team connects your laptop.

This means that during your presentation, you do **not** need to introduce your project's background, motivation, or purpose — the introduction will already provide this context. Your team should begin the presentation **directly with the demo and technical highlights**.

Your introduction should include:

1. Project name and one-sentence purpose
2. Target users or use case
3. 1–2 core features (what the app does)
4. Key mobile technologies used (e.g., Expo Router, Redux Toolkit, Expo Notifications)

Word Limit: 70–100 words

This corresponds to ~40 seconds of speech, which fits connection time.

Example

“Team 12 built StudyBuddy, a mobile study planner app for university students to organize sessions and track progress. Users can create timed study sessions, receive reminders, and view analytics on their habits. The app uses Expo Router for file-based navigation, Redux Toolkit for state management with AsyncStorage persistence, and Expo Notifications for session alerts. Our goal is to help students maintain consistent study routines with intuitive mobile interactions and device integrations like the pedometer for activity-based suggestions.”

The presentation should then **start immediately with the demo or technical walkthrough**.

Presentation Setup

To minimize transition overhead:

- Use **one single laptop** for the entire presentation.
- Decide **before class** which laptop will be used.
- All slides, emulator windows, and any recorded clips should be open and ready before your turn.

Note

The classroom supports **USB-C** and **HDMI**. If your laptop requires an adapter, please bring your own.

Live Demo Expectations

The primary purpose of the presentation is to show that your app’s **core features are implemented and functional**.

- A **live demo running on an emulator or simulator is strongly preferred**.
- You may also connect a physical device via Expo Go for demonstration if setup time is minimal and the connection is reliable.

Network-Dependent or Device-Specific Backup Option

If a feature depends on **network stability** (e.g., backend API fetch, user authentication, data sync) or **device hardware** (e.g., camera, motion sensors, notifications) that may not behave reliably in class, you may prepare a short pre-recorded clip as a backup.

Guidelines:

- The **presentation must still be delivered live** (only specific segments recorded).
- Use recordings **only for unstable network or device-specific portions**, not the entire presentation.
- Narrate what the recorded clip shows while it plays.
- Be ready to switch quickly between your live demo and recording if connectivity issues arise.

Examples

Feature Type	Demo Format	Notes
Core app features (navigation, state, UI)	Live on emulator	Preferred
Expo Go version on mobile device	Live if quick / Short clip otherwise	Optional
Backend data fetch / sync / login	Live or short recording	Allowed as backup if Wi-Fi unstable
Camera or sensor integration (Expo APIs)	Short recording allowed	Explain implementation while playing
Push or local notifications	Short recording allowed	Show trigger + response behavior

No Q&A During Presentations

Because of the large number of teams and limited class time:

- There will be **no Q&A** during or after presentations.
- Please do **not interrupt** presenters at any time.
- If something is unclear, you may **reflect this in your peer evaluation**, consistent with the [Presentation Rubric](#).

This ensures fairness and allows all teams equal time to present.

Summary

- Arrive by **13:05**; **class starts at 13:10**.
- **Next three teams** sit in the **front row**.
- Submit **70–100 word introduction** to [Quercus](#) [↗] by **Nov 17** (instructor will read during setup).

- **5 minutes presenting + 1 minute switching**, strictly enforced.
- **Begin directly with demo + technical highlights.**
- **One laptop**, prepared in advance.
- **Live demo on emulator preferred**; short clips allowed for network-dependent or device-specific features.
- **No Q&A and no interruptions.**
- **All members attend both days** for peer review.
